

Task descriptions:

Creation of algorithm subtasks:

- Make sure it can detect scheduling conflicts
- Create an auto-placing system based on task importance

Core algorithm logic: will place tasks in available day slots by iterating through all time slots available and placing them in random positions at a set frequency determined by the user.

Skills needed:

- Understanding of data structures
- Modular code design
- Control flow optimization
- Java will be used to program it

Creation of tasks subtasks:

- Ensure tasks have clear description boxes
- Ensure all are colour coded
- Make sure tasks can be grouped

Skills needed:

- Filtering and aggregation
- OOP
- Tasks and accounts will be held in a database on sqlite

Creation of data storing and accounts:

- Ensure data can be stored into an account

Skills needed:

- Relational links for accounts
- Key understanding of sql and database programing

Creation of reminders:

- Make sure reminders are sent when tasks are close to due date
- Make sure they are sent to users screen

Skills needed:

- Time calculation
- Background processing
- Notification API

Creation of GUI:

- Make sure tasks and calendar can be seen on screen visually
- Ensure typing is possible and displayed
- Ensure tasks can be moved and clicked on
- Ensure descriptions are visible

Skills needed:

- UI framework
- Event handling
- Layout and styling
- Will be done via java swing

Debugging and testing:

- Will create conflicting scenarios to test schedule conflict detection
- Ensure GUI displays all data properly and doesn't visually glitch or leave off data
